Sequence 55, Application Ws. US20040101820A1

GENERAL INFORMATION:
TULL CALL OF INVENTION: FOLYMUCIECTICE probe and primer derived from hepatitis B virus co.
TITLE OF INVENTION: from Japanese, chip including the same, kit including the same,
TITLE OF INVENTION: detecting hepatitis E virus using the same
TITLE OF INVENTION: detecting hepatitis E virus using the same
CURRENT APPLICATION NUMBER: US/10/239,090A

                                                                                                                                                               8
                                                                                                                                 Immunogenic hepatitis E virus (HEV) peptides are selected from the ORF1, ORF2 and ORF3 regions of HEV. The peptides can be used in vaccines to prevent infection by HEV. The antibodies can neutralise and block HEV infection and can be used to prevent or treat HEV infection. The peptides and antibodies can also be used as diagnostic reagents. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 24-OCT-2003 to standardise OS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence is that of the putative virus capsid protein encoded by Burma strain hepatitis E virus (HEV) open reading frame ORF2. This protein or peptide fragments of it may be used in a vaccine composition for immunising an individual against HEV. Antibodies raised against these peptides can also be used in such vaccines. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        TICIGGGGIGACCGGGIIGATICICAGCCCTICGCAAICCCCIAIAIICAICCAACCAAC 180
                                                                                                                                                                                                                                                                                                                                                                                                      The putative capsid protein (AAR96089) of hepatitis E virus (HEV) Burma strain is encoded by ORF-2 (AAT27107) of the virus. PCR amplification of ORF-2 allows prodn. of capsid protein or of C-terminal regions of the capsid protein (see also AAR96091, AAR96093 and AAR96095) and expression in Spodoptera frugiperda Sf9 insect cells using a baculovirus vector provides recombinant C-terminal regions (see also AAR96101 and AAR96103) useful as diagnostic reagents and in vaccines. The HEV Mexico strain capsid protein (AAR96090) may similarly be used. (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           40

```
A method has been developed for detecting hepatitis E virus (HEV) antibodies (Ab). The method comprises: (a) reacting a serum sample with a HEV peptide antigen; and (b) examining the peptide for the presence of bound Ab, where the presence of bound Ab indicates the presence of HEV Ab. The present sequence represents the protein from the open reading frame, ORF2, from HEV Burma strain. The method can be used to diagnose infection with the enterically transmitted non-A/non-B viral hepatitis agent HEV, specifically the HEV Burma and Mexico strains. (Updated on 25-field)
                                          Diagnosis of hepatitis E virus Burma and Mexico strain infection - by immunoassay with hepatitis E virus peptide antigens.
                                                                                                      Disclosure; Col 39-42; 36pp; English.
